

COPERT 2026 updates

What is new in COPERT v5.10.1

Overview

- Revision of consumption of LDVs running in liquid fuels
- Revision of emission factors of PHEV/HEVs cars
- Revision of emission factors of CNG cars
- Introduction of Battery Electric Trucks
- Revision of emission factors of L-category vehicles
- Other minor changes, software improvements & bug corrections

Revised consumption of LDVs running in liquid fuels

Revision of consumption of LDVs - Overview

- Real-world consumption & CO₂ data¹ from OBFCM devices:
 - >5M cars from EU27 countries running in liquid fuels registered between 2021-2023
 - >600k vans from EU27 countries running in liquid fuels registered between 2021-2023
 - WLTP vs real-world gap identified (reaching 300% for PHEVs)
- Data available for 2024 since Sept 2026 → incorporated in the next COPERT version
- Gradual expansion to all vehicles & powertrains²

Data processing flowchart

2. [Regulation - 2024/1257 - EN - EUR-Lex](#)
3. Small (A-B)/Medium(C)/Large (D,E,F) classification is based on the [EU classification of vehicle types](#) | [European Alternative Fuels Observatory](#)
4. [Data](#)
5. [Towards zero CO2 emissions: Insights from EU vehicle on-board data - ScienceDirect](#)

Revision of consumption of LDVs - Results

Average Fuel Consumption (l/100km) of **Cars** from OBFCM data 2021-2023

Average Consumption of **PHEV Cars** from OBFCM data 2021-2023

Average Fuel Consumption (l/100km) of **Vans** from OBFCM data 2021-2023

- **Charge sustaining** on avg in 62% & **Charge Depleting** in 38% of total distance:
 - **Charge Depleting in pure electric mode** in avg 27% of total distance
 - **Charge Depleting with engine on** in 11% of total distance
- **Grid energy into the vehicle** is Grid energy into the battery with a 15% offset increase for charging losses

Revision of consumption of LDVs - Impacts

- Relative adjustments also to other vehicles wo OBFCM data:
 - Relatively changes to pre-Euro 6 petrol cars
 - LPG ~15% less CO₂ from petrol cars aligned with literature^{1,2} to ensure physical consistency
- Estimated impact in national emission inventories:
 - w/o energy statistical balance, **CO₂** will:
 - **decrease < 5% for cars**
 - **increase < 5% for vans**
 - With energy statistical balance, no change in energy consumption & CO₂ but **mileage** will:
 - **Increase < 5% for cars**
 - **decrease < 5% for vans**

2. [Determination of Euro 6 LPG passenger car emission factors through laboratory and on-road tests: Effect on nation-wide emissions assessment for Italy - ScienceDirect](#)

Revised emission factors of PHEV/HEVs cars

Revised emission factors of HEV/PHEV: Overview

- Revision of **Petrol Hybrid** and **Petrol Plug-in Hybrid** **Euro 6 cars** emission factors, based on measurements conducted by Innovhub¹
- Available on-road (RDE) and in-lab (WLTC) measurement data for **8 Petrol Hybrid** and **4 Petrol PHEV** passenger cars of different segment (S/M/L)
- **RDE** test results were utilized for **CO, CO₂, NO, NO_x, SPN23** emission factors
- **WTLC** test results were utilized for **CH₄** and **HC** emission factors

Data processing flowchart

Revised emission factors of HEV/PHEV: Results

Revised emission factors of CNG cars

Revised emission factors of CNG cars: Overview

- Revision of **CNG Euro 6** cars emission factors, based on measurements conducted by Innovhub¹
- Available on-road (RDE) and in-lab (WLTC) measurement data for 4 CNG passenger cars of different segment (S/M/L)
- **RDE** test results were utilized for **CO**, **CO₂**, **NO**, **NO_x**, **SPN23** emission factors
- **WTLC** test results were utilized for **CH₄** and **HC** emission factors

Data processing flowchart

➤ *Data from VERA Horizon on CNG cars will be integrated in the next update*

Introduction of battery electric trucks

Battery Electric Trucks: Overview

- BET no tailpipe emissions, so focus only on consumption
- Multiple types of BET, scarce consumption measurement data → simulation model using vehicle specifications from public databases (EEA, OEMs, etc.):
 - Segmentation of BET in COPERT same with diesel trucks based on chassis (Rigid/Articulate) & GVW
 - Each model is used to simulate all the selected cases (700 total simulation cases):
 - 20 driving cycles
 - different cases for road slope (-6% – 6% with a 2% step)
 - load factor (0-100% with a 25% step) are simulated
 - Auxiliaries' consumption kept constant for all the cases
- Results validated vs standardized cycles & are automatically processed to derive the speed-dependent consumption factors for each road grade & load factor combination

Battery Electric Trucks: Vehicle model creation flowchart

Battery Electric Trucks: Results

Battery Electric Trucks: Impact

- Battery Electric Trucks (BET) were not part of COPERT until v5.9
- Still low uptake (0.5%) of BET in EU fleet but increasing market share among total HDTs sales^{1,2,3}
- The market uptake of BET is expected to grow exponentially over the next years (together with hydrogen-fueled trucks) so that OEMs meet the 45% CO2 reduction target⁴ by 2030
- Therefore, BET mainly important for projections
- Factors of BET will be updated, once new data available

3. [European Union \(EU27\) | European Alternative Fuels Observatory](#)
4. [Lorries, buses and coaches - Climate Action - European Commission](#)

Revised emission factors of L-category vehicles

Revised emission factors of L-cat vehicles: Overview

- Horizon Europe L-vehicles Emissions and Noise mitigation Solutions¹ (LENS). Project Activities:
 - 150 vehicles tested in-lab & on-road for emissions & noise
 - Remote sensing and tampering detection
 - Recommendations for pollutants & noise reduction
- Utilizing results of LENS for updating emission factors in COPERT:
 - Motorcycles, Mopeds, Quad & ATVs, Micro-cars
 - All Euro standards
 - EC, CO, NO_x, NO₂, PM, SPN, VOC, CH₄, NH₃, N₂O

Revised emission factors of motorcycles: Results

- Results for Mopeds 4-stroke <50 cm³

Revised emission factors of motorcycles: Results

- Results for Motorcycles 4-stroke 250 – 750 cm³

Software improvements & bug corrections

Other minor changes & bug corrections

- Corrections on estimated emission factors of Euro 7 vehicles relative to Euro 6
- Corrections of CH4 cold parameters
- Correction in brake emission factor of empty/full-loaded trucks
- Correction when importing hot parameters from excel
- Correct bugs when export to CRT & NFR
- Correction when importing STOCK (VECTO HDV)
- Other minor improvements in the software

Impact of all 2026 updates on emission inventories

Overall impact of 2026 updates in emission inventories

Emissions* Growth (%)	Passenger Cars	Light Commercial Vehicles	Heavy-Duty Vehicles	L-category	All fleet
Over 10% increase		CH4		NH3, SPN, CO, PM, BC, N2O, NOx	CO
Up 10% increase	CH4	CO2, SO2, Hg		VOC, NMVOC, CH4	CH4, NH3, SPN
Up to 10% decrease	CO, CO2, SO2, NMVOC	NMVOC		CO2, SO2, Hg	SO2
Over 10% decrease					
Minor (+-1%) or no change	Rest	Rest	Rest**	Rest	Rest

*Growth is calculated compared to 2025 COPERT version (v5.9.2) using EU fleet data for 2024-2025. Variations may occur among the EU countries with higher share of HEV, PHEV, CNG cars and L-cat vehicles.

** Introduction of battery electric trucks (BET) may have a small impact in energy consumption of emission inventories.
